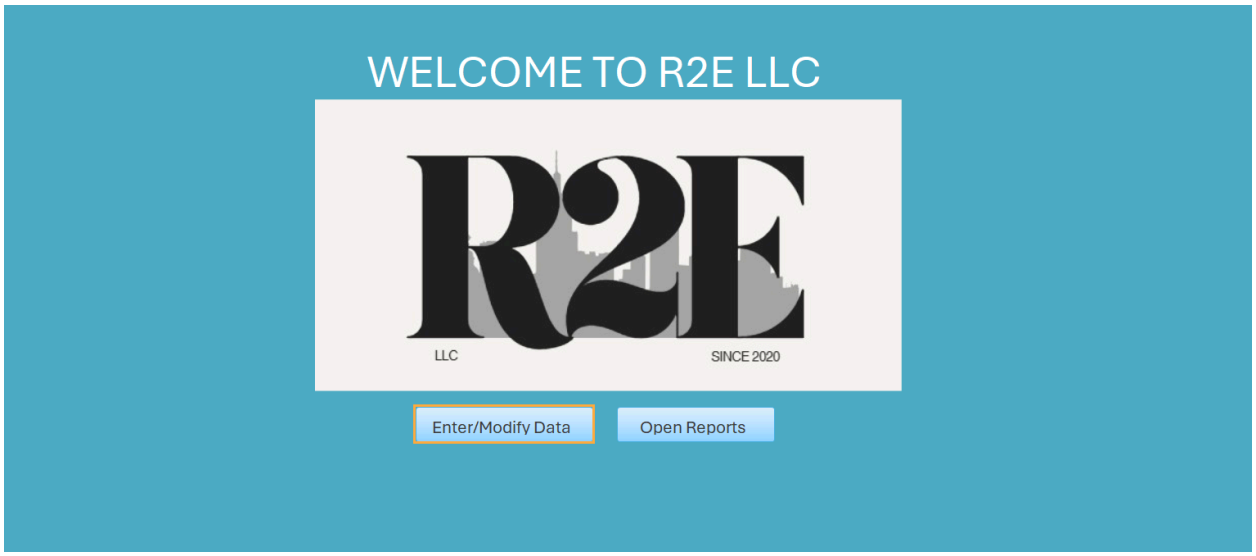
Data Entry & Navigation (Forms):

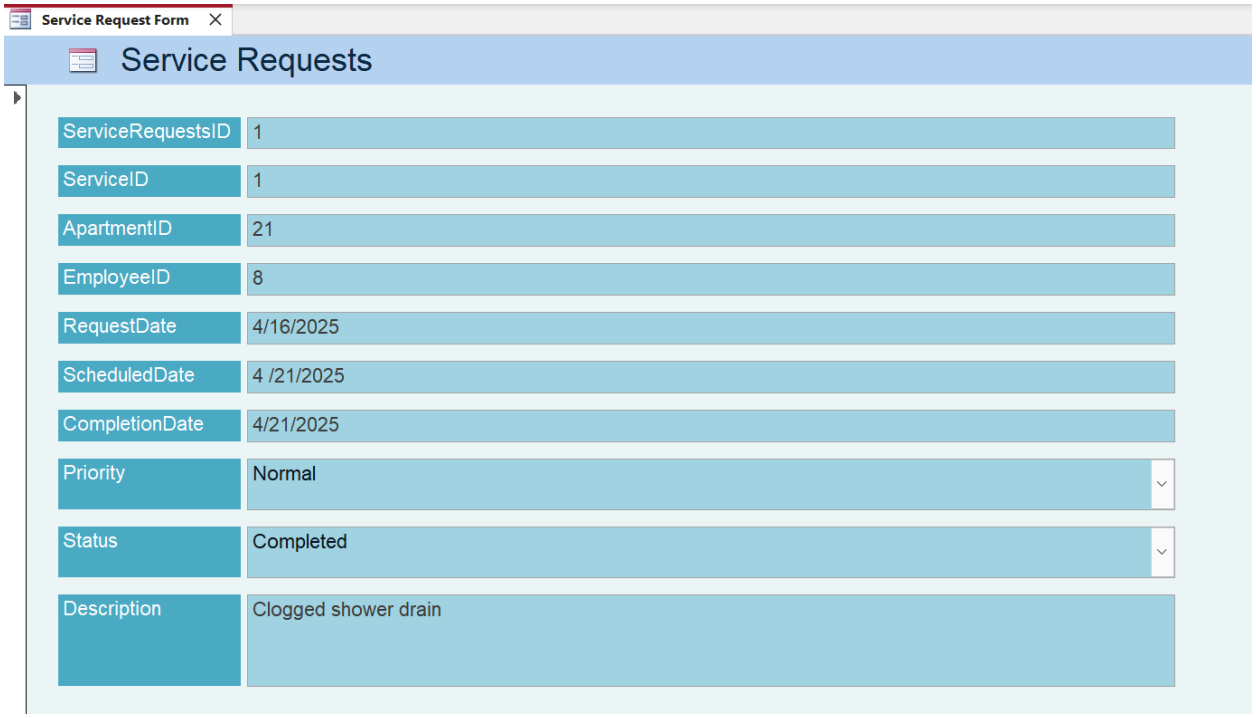
1. *Switchboard (Main Navigation)*

The Switchboard serves as the central navigation interface of the database. It provides structured access to data entry forms and reporting modules, allowing users to efficiently manage tenant records, service requests, and employee information. By organizing workflows into clear menu paths, the Switchboard improves usability and reduces operational confusion.



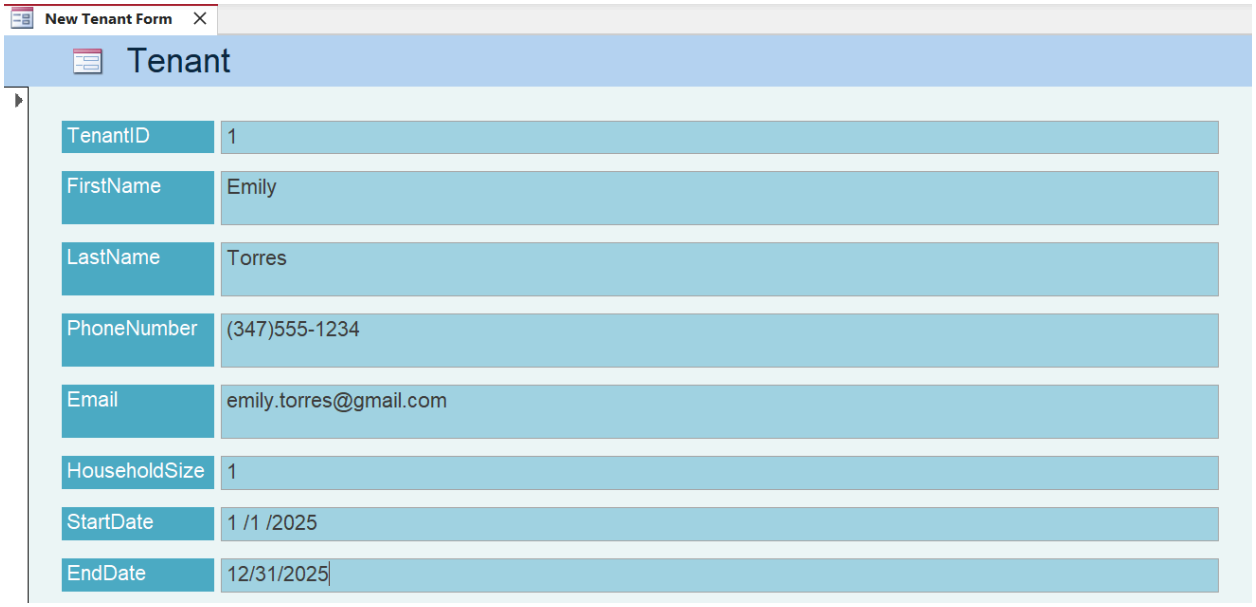
2. *Service Request Form:*

The Service Request Form captures maintenance requests submitted for individual units, including tenant details, issue type, and assigned employee. This structured data entry process enables management to track work orders, monitor completion timelines, and ensure accountability across maintenance operations.



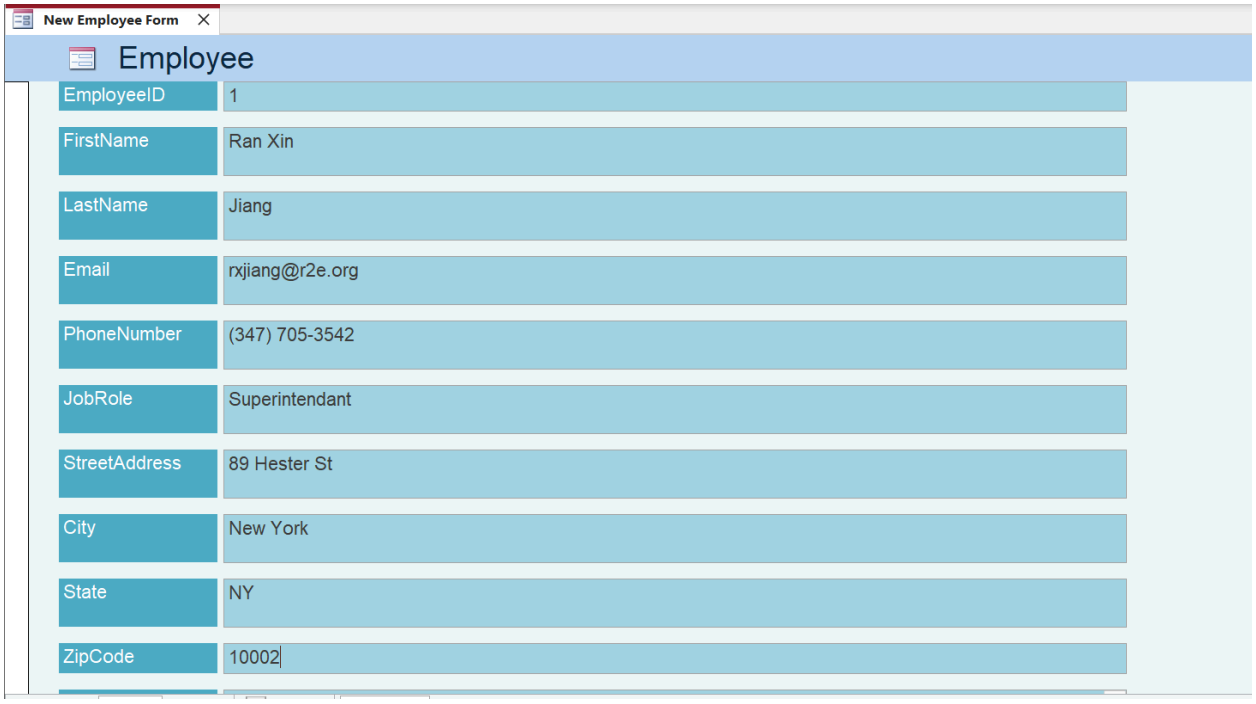
3. *New Tenant Form:*

The New Tenant Form is a comprehensive form that collects key information from every tenant. This form requests essential details such as the tenant's full name, email address, phone number, monthly rent, household size, and lease start/end dates. This form will be a helpful tool that enables the management team to maintain organized tenant profiles and streamline administrative processes.



4. *New Employee Form:*

The New Employee Form is a comprehensive onboarding form that will help building management collect essential information for newly hired staff. This form requests key details such as the employee's full name, job position, phone number, email address, and address. This form will play an essential role to enable the management team to maintain organized employee profiles and streamline onboarding processes.



Operational Monitoring & Reporting:

1. *Tenant Directory Report:*

The Tenant Directory Report provides a clear, alphabetical list of all tenants organized by building, offering quick access to essential resident information. This report includes each tenant's full name, unit number, phone number, email address, and lease start and end dates, allowing staff to easily verify occupancy and maintain up-to-date contact records.

2. *Property Maintenance & Service Request Report:*

The Property Maintenance & Service Request Report provides an overview of all maintenance activity across each property, including the number and types of service requests submitted monthly and the average time taken to complete them. By tracking completion speed, identifying recurring issues, and highlighting properties with unusually high request volumes, this report helps management spot problem areas, prioritize repairs, and determine when more significant actions, such as preventative maintenance or renovations, may be needed.

3. *Employee Performance Report:*

The Employee Performance Report provides a clear summary of each staff member's workload, productivity, and contribution throughout the year. This report includes the number of service

requests completed, the average time to resolve issues, the types of tasks handled, and any outstanding or recurring assignments. By highlighting completion rates, efficiency trends, and areas of responsibility, this report enables management to fairly evaluate employee performance, identify high-performing staff, and make informed decisions regarding annual bonuses, raises, and staffing needs.

4. *Open Service Request Report:*

The Open Service Request Report provides real-time visibility into unresolved maintenance tasks across properties. It displays submission date, service type, assigned employee, and current status, allowing management to identify delays and ensure timely resolution.

Analytical & Tracking Queries:

1. *Open Service Requests Query:*

Open Service Requests Query identifies all service requests that are currently open and not yet completed. It provides management with real-time visibility into outstanding maintenance issues, helping them prioritize urgent requests, monitor workload distribution, and ensure no requests are overlooked.

Open Service Requests Query

```sql
SELECT
    [Service Requests].ServiceRequestsID,
    [Service Requests].ServiceID,
    [Service Requests].ApartmentID,
    [Service Requests].EmployeeID,
    [Service Types].ServiceType,
    [Service Requests].RequestDate,
    [Service Requests].ScheduledDate,
    [Service Requests].Status
FROM
    [Service Types]
    INNER JOIN [Service Requests] ON [Service Types].ServiceID = [Service Requests].ServiceID
WHERE
    ((([Service Requests].Status) <> 'Completed'));
```

2. *Completed Service Requests Details Query:*

Completed Service Requests Details Query retrieves completed service requests along with the service type, assigned employee, apartment ID, and total completion time. It allows management to evaluate employee responsiveness, track operational efficiency, and assess whether service tasks are being completed within a reasonable timeframe.

Completed Service Requests Details Query

```sql
SELECT
    sr.ServiceRequestsID,
    st.ServiceType,
    datediff('d', sr.RequestDate, sr.CompletionDate) AS DaysToComplete,
    e.FirstName,
    e.LastName,
    sr.ApartmentID
FROM
    (
        [Service Requests] AS sr
        LEFT JOIN [Service Types] AS st ON sr.ServiceID = st.ServiceID
    )
    LEFT JOIN Employee AS e ON e.EmployeeID = sr.EmployeeID
WHERE
    sr.Status = 'Completed';
```

3. *Average Service Request Completion Query*

Average Service Request Completion Query calculates the average completion time for each service type. By identifying which types of requests take longer to resolve, management can better allocate resources, adjust staffing if necessary, and identify potential process bottlenecks.

Average Service Request Completion Query

```
SELECT
    [Service Types].ServiceID,
    [Service Requests].ServiceRequestsID,
    [Service Requests].ApartmentID,
    [Service Requests].EmployeeID,
    [Service Types].ServiceType,
    [Service Requests].RequestDate,
    [Service Requests].CompletionDate,
    [Service Requests].Status,
    Avg(DateDiff("d", [RequestDate], [CompletionDate])) AS AvgCompletionDays
FROM
    [Service Types]
    INNER JOIN [Service Requests] ON [Service Types].ServiceID = [Service Requests].ServiceID
WHERE
    ((([Service Requests].CompletionDate) IS NOT NULL))
GROUP BY
    [Service Types].ServiceID,
    [Service Requests].ServiceRequestsID,
    [Service Requests].ApartmentID,
    [Service Requests].EmployeeID,
    [Service Types].ServiceType,
    [Service Requests].RequestDate,
    [Service Requests].CompletionDate,
    [Service Requests].Status,
    [Service Requests].ScheduledDate;
```

4. *Property Maintenance & Service Request Query*

Property Maintenance & Service Request Query summarizes the total number of service requests received per property each month and the average days required for completion, grouped by service type. This helps management compare property-level performance, detect recurring maintenance patterns, and make more data-driven decisions regarding preventative maintenance planning and resource allocation.

Property Maintenance & Service Request Query

```
SELECT
    p.PropertyID,
    COUNT(sr.ServiceRequestsID) AS NumberOfRequests,
    st.ServiceType,
    Year(sr.[RequestDate]) AS RequestYear,
    Month(sr.[RequestDate]) AS RequestMonth,
    AVG(
        DateDiff('d', sr.[RequestDate], sr.CompletionDate)
    ) AS AvgCompletionDays
FROM
    (
        (
            [Service Requests] AS sr
            LEFT JOIN Apartment AS a ON sr.ApartmentID = a.ApartmentID
        )
        LEFT JOIN Property AS p ON a.PropertyID = p.PropertyID
    )
    LEFT JOIN [Service Types] AS st ON sr.ServiceID = st.ServiceID
WHERE
    sr.Status = 'Completed'
GROUP BY
    p.PropertyID,
    st.ServiceType,
    Year(sr.[RequestDate]),
    Month(sr.[RequestDate])
ORDER BY
    Year(sr.[RequestDate]),
    Month(sr.[RequestDate]);
```
